iMPD
The New Challenge

ABOUT US

KAGES is an independent project management consulting firm which has a strong knowledge of Subsea upstream activities

We help our clients to identify the risk profile of their undertakings, mitigate the risks and often manage them on their behalf. By doing so, we protect our client`s reputation and their financial interests.

We provide advisory, assurance, technical and rescue services during the whole project lifecycle, from rig/vessel selection to intake, commissioning and startup for new builds, upgrades or conversion/modification projects, subsea.

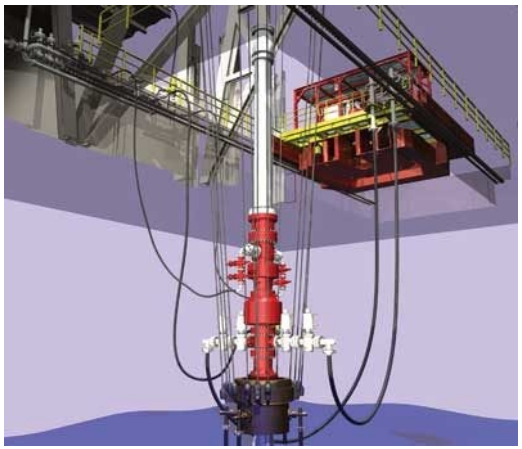

- Our team combines industry expertise and project management disciplines. Most of our people have over 20 years each in the Oil & Gas industry, specifically related to drilling rigs.
- Over 220 projects worldwide.

THE iMPD CHALLENGE

COOs, VPs, Directors of our Clients bring us in when:

- They feel they lack of necessary knowledge and guidance to make a successful and cost effective installation of a fully functioning MPD System
- They struggle to find the right expertise and resources to be able to assess the current MPD market and best alternatives available, and run a full project on their own
- They are hesitant to make an investment into an MPD turn key package or an individual sourced MPD system, as MPD is a relatively unknown emerging package
- They need an unbiased opinion on MPD equipment needed and currently available in the market
- They are aware they need a tailor-made system that will fit a specific vessel and they don't know what are the potential risks and implications associated with that

OUR OFFERINGS

We offer a high level of expertise and deep hands-on experience in the MPD field. We provide full and bespoke training courses to your organisation, as well as in-house project experts able to facilitate the definition and implementation of any of your MPD projects.

The training course will allow you and your team to:

- Understand and deliver a full MPD project from initial concept to full implementation
- Have the confidence to deliver a full operational system incorporating all necessary safety, regulatory and best industry standard practices.
- Meet and understand your client and partners demands and provide solutions to possible scenarios
- Save time, money and resources and highlight the industry pitfalls associated with the implementation of an MPD system.

The course includes:

- Commercial Contract, Scope of Supply, Functional Design Specification and a Supply, Service Contract and Project Execution and Control Plan.
- Equipment requirements when choosing an MPD system within a WBS
- The installation process (e.g. Shipyard Work).

WHY US

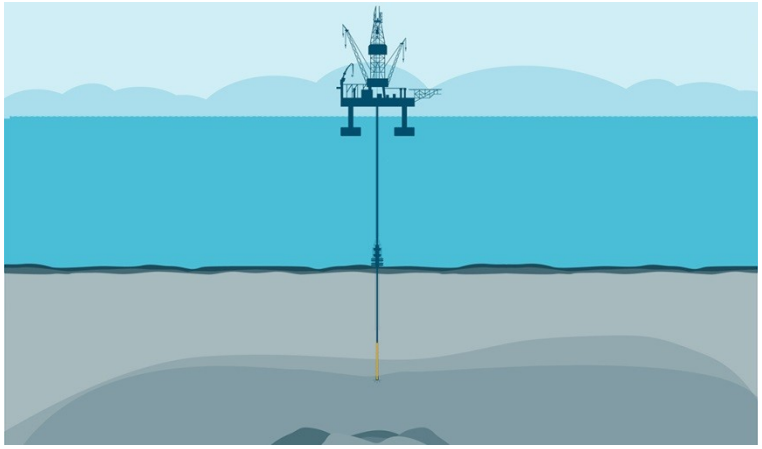

iMPD is an authority in the upstream and subsea industry, and we are very different from the other available alternatives:

- We are currently the only company able to deliver course that would provide the client with the necessary skills and expertise needed to successfully implement a full MPD project

- We are not just giving an overview of MPD, we are providing pragmatic solutions to problems that will be encountered during the course of a MPD project

- We don't bring to the table only expertise, but we bring with us lesson learned during our past and current experiences in similar projects across the globe

- We know better than other what risks shall be considered, and managed to avoid project failures

"I was told to deliver a comprehensive MPD package to meet the needs of one of our biggest clients. I needed to deliver a personalised MPD system, on budget, and with a time sensitive framework. In few days I was fully in charge.
If I had the opportunity of this training and knowledge I could have reduced my 18-month schedule by 5 months. I could have avoided a lot of unnecessary research and in turn a lot of wasted time."
